Xmultiple has developed a new and patent-pending technology called FlashPoint. The technology provides you with the freedom to transfer files between flash drives, 'Sharing-On-The-Go' (SOTG), without the need of a laptop computer or cumbersome USB bridges.

SOTG technology is embedded into Xmultiple's ShareDrive line of USB flash memory pen drives and you can download and upload data files between a ShareDrive pen drive and any other USB memory pen drive, or any other USB memory peripheral such as computers and MP3 players.

ShareDrives are small, lightweight devices and are powered by a rechargeable Lithium-ion battery. Storage capacities include 128KB, 256KB, 512KB, 1GB and 2GB sizes. Features include: one-step file transferring procedure, the ability to upload data from any computer or host device or any other pen drive, the ability to download data to other ShareDrives or any other pen drive, automatic USB battery pack power management, as well as a low-battery power indicator.

The ability to transfer data without the use of a computer or USB bridge means you can share business files, transfer mapping software to your vehicle, exchange or transfer data from one mobile phone to another, download digital photos from your camera to be shared with other USB flash drives or most any USB equipped peripheral, swap MP3 music or photo files, as well as make backup recordings of other pen drive files or USB equipped peripherals.
