

FlashPoint

ShareDrive

Crypt-FlashPoint ShareDrive

FP01-100C & FP01-200C

Features

Crypt-FlashPoint ShareDrives include software to password protect folders. When using your FlashPoint ShareDrive, the crypt software will stop other users from opening and modifying your personal files and folders.

When folders (subfolders) are password protected and locked, their contents cannot be read, copied, modified or deleted. To access the locked folders, you must supply the correct password (key). You can use the crypt software to lock folders on your hard drive, external and removable drives. Crypt Software will not allow access to the locked folders in Windows Safe Mode or DOS. You can even store your protected folders on an external or removable drive. The protected folder can be opened only if you know the correct password.

You can password protect folders located on your FlashPoint ShareDrive as well as on other USB hard drives.

How Do I Protect A Folder

Crypt FlashPoint ShareDrives software supports Windows Explorer. To protect a folder, right-click it and select **Lock With Folder** from the right-click menu. To unprotect the folder, double-click it and enter the password.

Who Creates the Passwords?

You create your passwords. Xmultiple/FlashPoint ShareDrives does not send your password, ID, or any of your private information. Forget your password, please use the Hint option of the Crypt software.
